**An analysis of sustainable urban concepts with strength lines such as Mobility, Emissions and Energy. These concepts are considered in the project “La Prolongación de la Castellana” in the north of Madrid, the largest sustainable urban project in Europe. This project will be the foundation for the process of analysis, definition, evaluation and valorization of urban sustainable indicators. The rating of quantitative indicators, which deals with a complex search for boundaries and gradation of the indicators, is combined with a more explanatory approach of qualitative indicators. Hence we become an evaluation system that combines a one-shot and a descriptive analysis that can be used as a framework to rate other urban projects.**

**Keywords:** transport, indicators, urban planning, sustainability, environmental acknowledgment
